Experiment No.: 1

Importing Business Datasets from CSV & MySQL and Connecting with Other Sources into Power BI

GitHub Repository Link: https://github.com/nidhidev2122/Business_analytics

Problem Statement

A retail company stores its business data across flat files (Excel/CSV) and a MySQL database. As a data analyst, connect Power BI Desktop to these data sources, import the required data, explore the Power BI interface, and create basic visuals to analyze sales by product, store, customer, and time.

Methodology / Steps Followed

Step 1: Data Collection

The AdventureWorks dataset was used for this experiment. The dataset consists of multiple files covering sales transactions, customer information, product details, territory data, and calendar information.

Figure 1: Power BI Desktop Home Screen

Step 2: MySQL Database Setup

Figure 2: MySQL Database Connection in Power BI

Step 3: Data Import in Power BI

Power BI Desktop was opened and data was imported from two types of sources using the Get Data option:

- **MySQL Database** - Server: localhost, Database: adventureworks. The Sales table containing 56,046 records was loaded into Power BI.
- **CSV Flat Files** - Customer Lookup, Product Lookup, Territory Lookup, and Calendar Lookup files were imported directly using the Text/CSV connector.

The data types of OrderDate and StockDate columns in the Sales table were converted from Text to Date format in Power Query Editor.

Figure 5: Product Lookup Table

Queries [9] fx = Table.TransformColumnTypes(#"Promoted Headers",{"SalesTerritoryKey", Int64.Type}, {"Region", type text}, {"Country", type text}, {"Continent", type text})

SalesTerritoryKey	Region	Country	Continent
1	Northwest	United States	North America
2	Northeast	United States	North America
3	Central	United States	North America
4	Southwest	United States	North America
5	Southeast	United States	North America
6	Canada	Canada	North America
7	France	France	Europe
8	Germany	Germany	Europe
9	Australia	Australia	Pacific
10	United Kingdom	United Kingdom	Europe

Figure 6: Territory Lookup Table

Figure 7: Calendar Lookup Table

Step 4: Data Modeling

After importing all tables, relationships were established between the fact table and lookup tables in the Model View to create a Star Schema:

- Sales → Customer Lookup (via CustomerKey)
- Sales → Product Lookup (via ProductKey)
- Sales → Territory Lookup (via TerritoryKey)
- Sales → Calendar Lookup (via OrderDate → Date)

This star schema ensures efficient filtering and accurate aggregation across all visuals in the dashboard.

Figure 8: Data Model — Star Schema in Model View

Step 5: Dashboard Development

An interactive dashboard titled "AdventureWorks Sales Performance Dashboard" was developed in the Report View. The following visuals were created:

- **3 KPI Cards** - Total Orders (25.164K), Total Quantity Sold (84K), Total Customers (18.149K)
- **Sales by Product** - Clustered Bar Chart showing quantity sold per product
- **Sales by Customer Occupation** - Donut Chart showing sales distribution across customer segments
- **Sales Trend Over Time** - Line Chart showing yearly sales growth from 2020 to 2022
- **Sales by Store Location** - Filled Map showing geographical distribution of sales
- **2 Slicers** - Region and Year for interactive filtering

Output

Figure 9: AdventureWorks Sales Performance Dashboard — Report View

The final Power BI dashboard titled "AdventureWorks Sales Performance Dashboard" successfully visualizes the retail company's business data. The dashboard provides:

- **Total Orders:** 25.164K orders recorded across 2020-2022
- **Total Quantity Sold:** 84K units sold across all product categories
- **Total Customers:** 18.149K unique customers served
- **Product Performance:** Water Bottle 30oz, Patch Kit, and Mountain Tire Tube are the top selling products
- **Customer Segments:** Professional customers contribute the highest sales at 31.63%
- **Sales Growth:** Consistent upward trend in sales from 2020 to 2022
- **Geographic Reach:** Sales recorded across North America, Europe, and Australia
- **Interactive Filters:** Region and Year slicers enable dynamic data exploration

Conclusion

This experiment demonstrated how data from **CSV files and a MySQL database can be integrated and analyzed using Power BI Desktop**. The AdventureWorks sales data was imported,

transformed, and organized into a structured data model by connecting the Sales table with relevant lookup tables. A star schema was created to support effective data analysis and filtering. The final dashboard presents sales information across **products, customers, regions, and different time periods**, providing a clear and interactive way to understand business performance and support informed decision-making.

Business Insights

The following key business insights were derived from the AdventureWorks Sales Performance Dashboard:

- **Product Demand:** A small group of products contributes significantly to the overall quantity sold, showing which items have stronger customer demand.
- **Customer Profile:** The Professional category forms the largest portion of the customer base by sales, suggesting that business-focused customers are an important source of revenue.
- **Performance Over Time:** The sales pattern improves across the three-year period, indicating that the business maintained positive momentum.
- **Regional Contribution:** North America contributes the largest share of the business activity, while the other regions provide additional growth opportunities.
- **Overall Sales Activity:** The large number of orders and units purchased indicates consistent customer purchasing activity throughout the period.
- **Dashboard Filtering:** Users can select a particular year or region to examine changes in performance instead of relying only on the overall totals.
